Example 13; SEQ ID NO 117; 272pp; Japanese.

storage protein.

```
The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that modulates amyloid-beta fibril formation or induces a prophylactic or therapeutic immune response against amyloid-beta fibril formation; or therapeutic immune system modulator that prevents or inhibits amyloid-beta fibril formation. Also described is a kit comprising (C). (C) have nootropic, neuroprotective, cerebroprotective, haemostatic. (C) inductopic, neuroprotective, cerebroprotective, haemostatic. (C) described in anti-HIV, antiparkinsonian, muscular, copthalmological, antithyroid, vasotropic, cardiovascular, tranquilliser, neuroleptic, cardiant, antidepressant, endocrine and hypnotic activities, and can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an amyloid-beta related disease e.g. Alzheimer's disease (including sporadic (non-hereditary) or familial (hereditary)), mild cognitive impairment, mild-to-moderate cognitive impairment, vascular dementia, cerebral companion, or a condition associated with Alzheimer's disease cognitive impairment, and companion body myositis, age-related macular companion or a condition associated with Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (including hypothyroidism, cerebrovascular disease, cardiovascular disease, memory loss, anxiety, a behavioural dysfunction (e.g. apathy, aggression, or incontinence), a neurological condition (e.g. Huntington's disease, amyotrophic lateral sclerosis, acquired immunodeficiency, parkinson's disease, aphasia, apraxia, agnosia, pick disease, dementia with Lewy bodies, altered muscle tone, seizures, sensory loss, visual field deficits, incoordination, gait disturbance, transient ischaemic attack or stroke, transient alextness, attention deficit, frequent falls, syncope, neuroleptic sensitivity, normal pressure hydrocephalus, subdural haemacoma, brain tumour, posttraumatic brain injury, or posthypoxic danage), or a psychological condition (e.g. depression, delusions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            illudion, hallucination, sexual disorder, weight loss, psychosis, a sleep disturbance, insomnia, behavioural disinhibition, poor insight, suicidal ideation, depressed mood, irritability, anhedonia, social withdrawal, or excessive guilt) in a subject e.g. human having agnomic mutation in an amyloid precursor protein gene, an ApoE gene, or a presentlin gene, that can be used as an antifibrillogenic amyloidosis inhibiting peptide in the exemplification of the present invention.
                                                                                    Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

The present invention describes a nucleic acid molecule (I) comprising a consecutive nucleic acid sequence (S1) of at least 15 bp in length and complementary with a nucleic acid sequence encoding a prolamine complementary with a nucleic acid sequence having a homology of at least bolypeptide or a nucleic acid sequence having a homology of at least comprising a nucleic acid sequence (A) having about 70% homology to a nucleic acid sequence encoding a prolamine polypeptide and a nucleic acid sequence encoding a prolamine polypeptide (I) a factor (II) capable of causing RNA interference of the gene sequence encoding a prolamine polypeptide, (I) a factor (II) capable of causing RNA interference of the gene sequence encoding a prolamine polypeptide, (I) a plant cell (II) producing (III), (I) a plant tissue (III) containing (I); (I) a plant tissue (III) comprising (I); (I) a plant tissue (IVII) produced by (VIII); (II) starch producing (III) (I) a vector (IVI) or (VIII); and (II) a composition containing gene produce of foreign gene produced from (VIII).

(I) is useful for decreasing the expression level of a protein in the seed of a plant, for expressing a foreign gene in the seed of a plant into the cell of the plant, radifferentiating the containing the expression of a natural protein in the seed of a plant and obtaining the set of a plant, and obtaining the seed from the transgenic plant. The method of expressing a foreign gene in the seed of a plant, and obtaining the seed from the transgenic plant, and obtaining the seed of a plant involves providing (I) and the mucleic acid molecule encoding a foreign gene product into cell of the plant, expension of expersing a foreign gene in the seed of a plant involves providing (I) and the method encoding transgenic plant havin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is the calmodulin (CaM)-binding region of mouse inducible nitric oxide synthase (1NOS). INOS is one of three isoforms of the enzyme NOS, which synthesises nitric oxide from the amino acid L-arginine. The sequence is provided for comparison with endothelial nitric oxide synthase (eNOS). The threonine residue at position 495 of eNOS is phosphorylated by AMP-activated protein kinase (AMPK) in the absence of Ca2+-CaM. Phosphorylation results in inhibition of eNOS. In the presence of Ga2+-CaM, phosphorylation by AMPK occurs predominantly at Ser-1177 and eNOS is activated. Modulators which activate AMPK may be used in the treatment of ischaemic heart disease by promoting glucose and fatty acid metabolism, and improving nutrient and oxygen supply to the myocytes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             vasotropic; antiangiogenic; gene therapy; critical limb ischaemia; CLI; eNOS; endothelial nitric oxide synthase; angiogenesis; microvascular dysfunction; human; calmodulin binidng domain;

                                                                                                                                                                        The invention describes a method of creating critical limb ischaemia (CLI) comprising administering to a patient a polynucleotide encoding a mammalian eNOS (endothelial nitric oxide synthase) polympeptide. Also described are: a method for treating angiogenesis by administering to a patient a polynucleotide encoding eNOS; and ameliorating microvascular dysfunction by administering to the patient the polynucleotide encoding the eNOS polypeptide. The method is useful for treating critical limb ischaemia or anglogenesis, or ameliorating a microvascular dysfunction. This is the amino acid sequence of a human neuronal nitric synthase (nNOS) calmodulin binding domain peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mouse iNOS calmodulin-binding site amino acid sequence SEQ ID NO:7.
administering to a patient a polynucleotide encoding a mammalian endothelial nitric oxide synthase (eNOS) polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                               New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents the calmodulin-binding site of mouse iNOS amino acid sequence. The present invention describes endothelial nitric coxide synthase (eNOS) mutants having one or more mutations in an amino acid sequence corresponding to a functional domain of a mammalian eNOS.

At least one of the mutations is at a position corresponding to an amino acid sequence corresponding to a functional domain that is phosphorylated in mammalian cells, and not an amino acid substitution to Ala or Asp. Also described: (1) an isolated eNOS polypeptide mutant that is substantially commologous, or has a 95-9% sequence identity to the amino acid sequence of the novel eNOS polypeptide mutant; (2) an isolated polypucleotide cording the polypeptide mutant; (3) a recombinant vector comprising the polypeptide mutant; (4) a plantanceutical composition comprising the polypeptide mutant; (6) modulating eNOS activity in a cell by administering the polypeptide mutant or the polymucleotide; (5) a binding partner of the polypeptide mutant; (6) modulating eNOS activity in a cell by administering the polypeptide mutant or the polymucleotide to the cell; (6) a patient with the polymucleotide, and detecting a cell of a patient with the polymucleotide, and detecting a level of eNOS activity by administering the polymucleotide, and detecting a level of eNOS activity by administering a condition associated with abbrrant eNOS activity by administering a condition associated with abbrrant eNOS activity by administering a condition associated with abbrrant eNOS activity by administering a condition associated with abbrrant eNOS activity by administering a condition associated with abbrrant eNOS activity by administering a condition associated with abbrrant eNOS activity by administering a condition associated and anorectic activity by administering a condition associated with abbrrant eNOS activity. The eNOS mutant be polypeptide mutant, polymucleotide and mutant or polymucleotide activity. An isolated calcium dependence and increased a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New plant genes encoding polypeptides having an activity involved in or associated with the synthesis, metabolism or degradation of carbohydrates in the plant grain useful in generating plants having improved nutritional properties.
                                                                 Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  plant biotechnology; carbohydrate synthesis; carbohydrate metabolism; carbohydrate degradation; carbohydrate, plant grain; grain filling; corn; tomato; banan; canola; cotton; peanut; sorghum; tobaco; sugarbeet; wheat; rice; protein; oil; starch; fibre; moisture content; cereal grain;
                                                                                                                                                                             The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA00010-AA013910) that exhibit activity elating to yvtokine, cell proliferantian or which may induce production of other cytckines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytckine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

This invention, in the area of plant biotechnology, relates to novel polymucleotides comprising a nuclectide sequence encoding a protein which is involved in or associated with the synthesis, metabolism or associated with the synthesis, metabolism or described which is up-regulated during grain filling. The plant is selected from corn, tomator, banana, canola, cotton, peanut, sorghum, tobacco, sugarbeet, wheat, and rice. The invention may be useful for the improvement of protein, oil, starch, fibre and moisture content of the cereal grains. In addition, carbohydrate levels may be modified to a more desirable level using the present invention. The present sequence is the sequence of a rice protein of the invention. Note: The sequence data for this patent did not form part of the printed appecification, but was obtained in electronic format directly from WIPO at thp.wipo.int/pub/publishedpct_sequences.

polynucleotides comprising a nucleotide sequence encoding a protein which is involved in or associated with the synthesis, metabolism or degradation of carbohydrates in the plant grain and the expression of which is up-regulated during grain [11] in the plant is selected from corn, tomato, banana, canola, cotton, peanut, sorghum, tobacco, sugarbeet, wheat, and rice. The invention may be useful for the improvement of protein, oil, starch, fibre and moisture content of the cereal grains. In addition, carbohydrate levels may be modified to a more desirable level using the present invention. The present sequence is the anno acid sequence of a rice protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/publishedpct_sequences.
                                                                                                                                                                                                                                                                                                              Human; immune; haematopoietic; immune/haematopoietic antigen; cancer; cytostatic; gene therapy; vaccine; metastasis.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) and acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome expression by rectifying mutations or deletions in a patient's genome cupplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the patients own production of (I). Additionally, (I) colorins and polynucleotides may be used to protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic antigen genomic expresent human immune/haematopoietic antigen genomic sequences from the present invention. AAK64942 to AAK84950 and AAM82169 represent invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 11; SEQ ID NO 11385; 3071pp + Sequence Listing; English.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB77177-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                     The invention relates to 2495 novel polynucleotides (I) and their encoded polypeptides, sequences hybridizing to these nucleotides, sequences encoding partial polypeptides and sequences having 70% to 90% identity to the nucleotide and protein sequences. The nucleotides and polypeptides are useful as diagnostic markers or therapeutic target for the diseases or morbid states. They are also useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers. This sequence corresponds to a protein sequence of the invention.

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A selected from one of the 2722 sequences defined in the specification. A diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnostic associated with human molecules, e.g. cell proliferative disorders, or disorder, neurological disorders, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp concerns may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline colymorphisms, as molecular weight markers, and for somatic or germline colymorphisms, the present sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                    New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or

                                                                                                                                                                                                                                                        This invention relates to novel nucleic acids encoding human PRO secreted and transmembrane proteins. Extracellular proteins play important roles on the formation, differentiation and maintenance of mulicellular organisms. The fate of many individual cells (for example proliferation, corganisms. The fate of many individual cells (for example proliferation, corganisms. The fate of many individual cells (for example proliferation, corganisms. The fate of many individual cells (for example proliferation, corganisms. The information is often transmitted by secreted polypetudes (for example mitogenic factors, survival factors, cyctocoxic factors, differentiation factors, cell receptors or membrane bound proteins. These membrane bound proteins and receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of receptor-ligand inneractions. The current invention provides the amino acid sequences of novel human membrane bound receptors and proteins of the invention may have cytostatic activities through the stimulation of chondrocytes. The nucleic acids of the invention may be useful for the manufacture of a medicament for diagnosing or treating a ctumour in a mammal. In addition, they may be useful for measuring or detecting the expression of a tumour associated gene. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          mitochondrial; human; screening assay; diabetes mellitus;

This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, ostecarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial compositions acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRP) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, anticonvulsant, antiarthritic, osteopathic, ophthalmological and cytostatic activities. This polypeptide sequence is a human heart mitochondrial protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö.

The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises determining the expression level of a marker gene in a biological sample from a subject, comparing the expression level determined with the expression level of the marker gene in a biological sample from a healthy subject, and judging whether the subject has bronchial asthma or chronic cobstructive pulmonary disease. The marker gene comprises: (a) a group of genes (51) whose expression levels increase when respiratory epithelial cells are stimulated with interleukin-13, or (b) a group of genes (52) whose expression levels decrease when respiratory epithelial cells are stimulated with interleukin-13, and obstructive pulmonary disease; (c) a kit for screening for chronic obstructive pulmonary disease; (1) an animal model for bronchial asthma or chronic obstructive pulmonary disease; (2) a minducer that induces bronchial asthma in a mouse; (5) a manker gene or an animal model for bronchial asthma or chronic obstructive pulmonary disease; (c) a marker gene or an antisense nucleic acid corresponding to a portion of the marker gene or an antisense nucleic acid corresponding to a portion of the marker gene or an antisense nucleic acid corresponding to a portion of the marker gene or an antisense nucleic acid corresponding to a portion of the marker gene, a ribozyme, a polynucleotide that suppresses the probe has been immobilised to assay a marker gene; on which a probe has been immobilised to assay a marker gene, on the describing for a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease, on which a probe has been immobilised to assay a marker gene, and the present for certing for or screening for a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease. The present corresponding of the present invention of th
                                                                                                                                                                                                         ing for bronchial asthma or chronic obstructive pulmonary disease by aring the expression level of a marker gene in a biological sample a subject with the expression level of the gene in a sample from a

Marker gene related amino acid sequence SEQ ID NO:747.

asthma; chronic obstructive pulmonary disease; ry epithelial cell; interleukin-13; respiratory; antiasthmatic; gene therapy; marker. bronchial

Homo sapiens EP1394274-A2

ADJ75495 standard; protein; 925 AA. 20-MAY-2004 (first entry)

antipsoriatic; gene therapy; psoriasis; diagnosis. Antipsoriatic protein sequence #610. 01-JUL-2004 (first entry) **XXXXXXXXX**

correpresent invention describes a method of the brings determining the expression level of a marker gene in a biological sample from a subject, comparing the expression level determined with the expression level of a marker gene in a biological sample from a subject, comparing the expression level determined with the expression level of the marker gene in a biological sample from a healthy comparing whether the subject has bronchial asthma or chronic obstructive pulmonary disease. The marker gene comprises: (a) a group of genes (S1) whose expression levels increase when respiratory epithelial cells are stimulated with interleukin-13; or (b) a group of genes (S2) whose expression levels decrease when respiratory epithelial cells are stimulated with interleukin-13; and (b) a group of genes (S2) whose expression levels decrease when respiratory epithelial cells are stimulated with interleukin-13; also described: (1) a reagent (1) for testing for bronchial asthma or chronic obstructive pulmonary disease; (2) a kit for screening for a candidate compound for a therapeutic agent (c) a mannal model for bronchial asthma or chronic obstructive pulmonary disease; (4) an inducer that induces bronchial asthma in a mouse; (5) a marker gene or an antisense nucleic acid corresponding to a portion of asthma or chronic obstructive pulmonary disease, comprising the compound, a marker gene or an antisense, a polynucleotide that suppresses the expression of the gene through an RNAi effect or an antibody recognising core probe has been immobilised to assay a marker gene, and (7) a DNA chip for testing for core pronchial asthma or a chronic obstructive pulmonary disease, on which a probe has been immobilised to assay a marker gene, and can be used in gene therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease. The method is useful for testing for or screening for a therapeutic agent invention.

C sequence is used in the exemplification of the present invention. Testing for bronchial asthma or chronic obstructive pulmonary disease by comparing the expression level of a marker gene in a biological sample from a subject with the expression level of the gene in a sample from a present invention describes a method of testing for bronchial asthma Izuhara K; Nagai H, Example 11; SEQ ID NO 747; 241pp; English. This invention relates to the novel association of protein sequences (and the genes which encode them) to the NF-kappaB pathway. The invention may be useful for the production of compounds with an antininflammatory, cytostatic, hepatotropic, virucide, antiarteriosclerotic, antininflammatory, cytostatic, hepatotropic, virucide, antiarteriosclerotic, antininflammatory, cytostatic, carboroprotective, vasotropic, immunosuppressive or ulmerary activity or for gene therapy. The proteins and nucleotides are useful for diagnosing, preventing, treating, or ameliorating conditions or diseases associated with the NF-kappaB pathway. The condition is an immune disorder, an inflammatory disorder. The inflammatory disorder in inflammatory disorder in inflammatory disorder in inflammatory disorders. As the protein and disorder in inflammatory disorder in inflammatory disorders, inmunodeficiency, viral infection, host cell cetodermal dysplasia, X-linked anhidrotic cetodermal dysplasia, viral inflammatory cetodermal dysplasia, inmunodeficiency, viral inflammatory consurvival, evasion of immune responses, rheumatoid arthritis, inflammatory bowel disease, colitis asthma, atherosclerosis, cachexia, euthyroid sick syndrome, stroke, EAE, autoimmune disorders, disorders related to aberrant acute phase responses, hypercongenital conditions, birth defects, necroic lesions, wounds, crajection, disorders related to aberrant signal transplant rejection, conditions related to organ transplant conditions prelated to organ transplant conditions prelated to organ transplant conditions conditions related to aberrant signal transduction, with the novel association with the NP-kappaB pathway of the invention Note This sequence does not appear in the specification but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotides and polypeptides associated with NF-kappaB pathway, useful for diagnosing, treating, or preventing disorders or diseases associated with NF-kappaB pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PRO; antiinflammatory; antiarthritic; antirheumatic; immunosuppressive;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   osteopathic, antidiabetic, dermatological; antipsoriatic, antiallergic; antiasthmatic; hepatotropic; respiratory; gene therapy; immune system.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel isolated nucleic acid and the PRO polypeptide encoded by it. A protein of the invention has antidiable to demachase to mininflammatory, antiarthritic, anticheumatic, immunosuppressive, careignathic, antidiabletic, demachological, antipsoriatic, antidiabletic, demachological, antipsoriatic, antidiabletic, demachological, antipsoriatic, antidiabletic, and separatory activity. A polymucleotide of the invention may have a use in gene therapy. The PRO polypeptide, its agonist, antagonist, or antibody that specifically binds to the compact of juvenil experimental antimumer related disorder such as pystemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, cystemic systemic systemic arthritis, a spondyloarthropathy, systemic sclerosis, andiopathic inflammatory myopathy, Sjogren's syndrome, systemic construction, indiopathic demyelinating polymeuropathy, Guillain-Barre syndrome, a chronic inflammatory demyelinating polymeuropathy, a hepatobiliary confinence or antidemume chronic active hepatitis, primary confinence or immune-mediated skin disease, a sthma, allergic rhinitis, atopic dermatitis, pooriasis, an allergic chimitis, atopic dermatitis, pooriasis, an allergic configuration inflammatory, thyroxeanci; torus, thyr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               eosinophilic pneumonia, idiopathic pulmonary fibrosis, hypersensitivity pneumonitis, a transplantation associated disease, graft rejection or graft-versus-host disease. The present sequence represents a PRO protein

This invention relates to novel agents that modulates the function of thuman apoptosis-associated proteins specified within the specification. C human apoptosis-associated proteins specified within the specification. Specifically, it refers to a method for the identification of target correlated with an early stage in the certains of apoptosis. The present invention describes a method of regulation of apoptosis. The present invention describes a method of contacting either candidate agents or control agents to the target genes and assessing the difference of binding and inhibitory activity, where the candidate agent is selected from a low molecular weight organic molecule, an antibody or fragment thereof, an antisense oligonuclectide, a small inhibitory dsRNA, or a ribozyme. As such, the compositions and contends are useful for diagnosing and treating diseases or conditions associated with abnormal apoptosis in mammalian tissue, such as cancer, inflammation, autoimmune or neurodegenerative disorders. Accordingly, they exhibit cytostatic, antinflammatory, immunosuppressive and control and activities. These may also be used for drug screening propression is modulated by novel agents of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying an agent that modulates the function of an apoptosis-
associated polypeptide, useful for diagnosing or treating e.g. cancer,
comprises comparing the binding of the polypeptide to the candidate agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to antisense compounds, especially oligomucleotides, which are targeted to a nucleic acid encoding inducible nitric oxide synthase and which specifically hybridise to and modulate expression of inducible nitric oxide synthase. The antisense compounds have immunomodulator, antidiabetic, cardiovascular, cardiant, neuroprotective, disorder and vasotropic activity. The antisense oligomucleotides are useful for inhibiting the expression of inducible nitric oxide synthase in cells or tissues. In particular, the antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense oligonucleotides for modulating the expression of inducible nitric oxide synthase in cells or tissues, particularly useful for treating e.g. immunological, cardiovascular or neurological disorders, or
                                                                                                                The invention relates to two DNA molecules encoding inducible nitric oxide synthase (iNOS) proteins, where the DNA molecules comprise defined sequences of 4041 and 4165 base pairs given in the specification and the proteins have 1144 amin acids. Also claimed are expression vectors containing the DNA molecules, and recombinant host cells containing the vectors. The DNA molecules are useful for producing the recombinant proteins. The present sequence represents inducible nitric oxide, long isoform. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense oligonucleotide; inducible nitric oxide synthase; modilate expression; immunomodulator; antidiabetic; cardiovascular; cardiant; neuroprotective; vasotropic; ischaemia; reperfusion injury; 2'-0-methoxyethyl; phosphorothioate; mouse.
                    DNA encoding inducible nitric oxide synthase proteins - useful for producing recombinant proteins.
                                                                                                                                                                                                                                                                                                                                        Length 1144;

                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inducible nitrogen monoxide synthase (iNOS) was isolated from mice, and is encoded by AAQ94252. iNOS is homodimer with a mol. wt. of 130 kDA per subunit. The activity of iNOS is independent of calmodulin and cellular calcium levels. Vectors contq. the DNA are used in the treatment or prevention of vascular diseases, high blood pressure, arteriosclerosis, stenosis or restenosis of blood vessels, esp. coronary vessels after percutane transluminal coronary angioplasty. See AAR77363 and AAR77362 for endothelial and brain-derived NOS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inducible nitric oxide synthase; iNOS; recombinant protein; cDNA library;

isoform Mus sp.

oligonucleotides are useful for treating diseases or disorders associated with inducible nitric oxide synthase, e.g. diabetes, immunological disorder, cardiovascular disorder, neurological disorder or ischaemia/reperfusion injury. The antisense oligonucleotides are also useful. for research and diagnostics. The present sequence is that of mouse inducible nitric oxide synthase 888888888

US-09-747-408-18

i Sequence 18

sequence 18. Application US/09747408

i Ratent NO. 6670399

i GENERAL INFORMATION:

APPLICANT: Green, Allan M.

ITILE OF INVENTION: Compounds And Methods For Modulating

TITLE OF INVENTION: Cerebral Amyloid Angiopathy

FILE REFERENCE: NBI-088

CURRENT APPLICATION NUMBER: US/09/747,408

CURRENT APPLICATION NUMBER: 02/09/12-22

PRIOR FILING DATE: 1999-12-23

NUMBER OF SEQ ID NOS: 24

SOFTWARE: EsstSEQ for Windows Version 4.0

SEQ ID NO 18

LENGTH: 7
                                                                                                                                                                                                                                                                                                                                   GENERAL INFORMATION:

US-08-766-596A-1

US-08-766-596A-1

Sequence 1, Application US/08766596A

Patent No. 6462171

GENERAL INFORMATION:
APPLICANT: SOTO-JARA, Claudio
APPLICANT: BANMANN, Marc
APPLICANT: ERANGIONE, Blas
TITLE OF INVENTION: COMPOSITIONS THEREOF FOR TREATMENT OF DISORDERS OR DISEASES
TITLE OF INVENTION: ASSOCIATED WITH PROTEIN FOLDING INTO AMYLOID OR AMYLOID-LIKE
TITLE OF INVENTION: DEPOSITS
                                                                                                                                                                                                                                                                           RESULT 30

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 24, Application US/09724961

Patent No. 6743427

GENERAL INFORMATION:
APPLICANT: Schenk, Dale B.
APPLICANT: Vagquez, Nicki
APPLICANT: Vadanck, Ted
TITLE OF INVENTION: Prevention and Treatment of Amyloidogenic Disease
TITLE OF INVENTION: Prevention and Treatment of CURRENT APPLICATION NUMBER: US/09/724,961

CURRENT APPLICATION NUMBER: US/09/724,961
; OTHER INFORMATION: Description of Artificial Sequence:10-mer peptide; OTHER INFORMATION: from AN1792 sequence (human Abeta42, beta-amyloid; OTHER INFORMATION: peptide)
US-09-724-961-22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           OTHER INFORMATION: Description of Artificial Sequence:10-mer peptide; OTHER INFORMATION: from AN1792 sequence (human Abeta42, beta-amyloid; OTHER INFORMATION: peptide)

Sequence 21, Application US/09724551
| Patent No. 6787637
| GENERAL INFORMATION:
| APPLICANT: Schenk, Dale B. |
| APPLICANT: Bard, Frederique |
| APPLICANT: Wednock, Ted |
| APPLICANT: Yednock, Ted |
| TITLE OF INVENTION: Prevention and Treatment of Amyloidogenic Disease |
| TITLE NEFERENCE: 15270J-004760US |
| CURRENT APPLICATION NUMBER: US/09/724,551 |
| CURRENT PILING DATE: 2000-11-28 |
| PRIOR APPLICATION NUMBER: US/09/580,018 |
| PRIOR APPLICATION NUMBER: US 09/322,289 |
| PRIOR PILING DATE: 1999-05-28 |

Antifibrillogenic peptide #2.

Nootropic; neuroprotective; antifibrillogenic; amyloidosis inhibition; cytoprotection; amyloid deposit degradation; amyloidosis disorder; Alzheimer's disease. 04-MAY-2000; 2000WO-CA000515. 99US-0132592P. WO200068263-A2. Homo sapiens. 05-MAY-1999; 16-NOV-2000.

Chalifour R, Gervais F, Gupta A; (NEUR-) NEUROCHEM INC.

```
crause our resulutes with outer amilion art produced using) non-self ragments. Vaccines of the invention are produced using in non-self competitions need to be performed from the unnatural D-configuration amino acids to avoid the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with at least 1 region of an amyloid-beta peptide, or their immunogenic fragments, protein conjugates, immunogenic derivative peptides and immunogenic peptidemimetics. Examples include all-D peptides and immunogenic peptidemimetics. Examples include all-D peptides and corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 10-16, 16-21 and corresponding to residues edicites a preferential TH-2 or TH-1 response, in ABBSE623-64. The vaccine edicites a preferential TH-2 or TH-1 response, or related diseases may be localised amyloidosis, e.g. diabetes type II, controdegenerative diseases, scrapie, cerebral amyloid angiopathy, and control diseases, scrapie, cerebral amyloid angiopathy, and control diseases, scrapie, cerebral amyloides associated with chronic infection (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) patients

"The angle of the angle of the angle of the anglobatis associated with contract of the anglosis found in long-term haemodialysis patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New amyloid-targeting imaging agents useful for in vivo imaging amyloid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Amyloid; imaging agent; Creutzfeldt-Jakob disease; Kuru; CJD; transmissible cerebral amyloidosis; transmissible virus dementia; scrapte; transmissible milk encephalopathy; BSE; type II diabetes; bovine spongiform encephalopathy; inflammation associated amyloid; primary amyloidosis; feline spongiform encephalopathy; affaremer; disease; prion-mediated disease; blood-brain barrier; diapated amyloidosis; light chain-related amyloidosis; cerebral amyloid angiopathy.

                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                          Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Preventing/treating amyloid-related disease, especially Alzheimer's disease, comprises administering antigenic all-D peptide, eg. as vaccine, which elicits production of antibodies to prevent fibrillogenesis and associated cellular toxicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is that of an all-D peptide suitable for use for preparing vaccines for preventing or treating Alzheimer's disease and other amyloid related disorders in humans. It is based on a portion of amyloid-beta peptide (see AAB2522), and may be modified by removing or inserting 1 or more amino acid residues, or by substituting 1 or more
                                    Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.

                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CCCCXBXB4XBX5XBXBXBXBXBXBXBXBXBX8XXBX8XBXBXBXBXCCCCC
                                                       The invention relates to an amyloid-targeting imaging agent comprising an amyloid targeting moiety, a linker moiety and a labelling moiety. The camploid targeting moiety, a linker moiety and a labelling moiety. The capent is of general formula At-(Allnk) a-Allab (I) where z = 0 - 1;

CA t = an amyloid targeting moiety. All of the satient moiety; and Allab (CC = a labelling moiety. Also included are imaging amyloid deposition or diagnosing an amyloid-related condition in a patient involving administering (I) to the patient, and ultrasound imaging (I) in the patient to determine the presence of amyloid or amyloid-related condition (I) a reducing agent, a buffering agent, a transchelating agent, and instructions for the preparation and use of the radiopharmaceutical in the imaging of amyloid or an amyloid-related condition. The agents are used for imaging of amyloid deposition and for diagnosing an amyloid related condition e.g. Creutzfeldt-Jakob disease (CUD), kuru, transmissible condition e.g. Creutzfeldt-Jakob disease (CUD), kuru, transmissible creephalopathy (BSE), inflammation-associated amyloidosis, felline spongiform encephalopathy, non-transmissible creephalopathy (BSE), inflammation-associated amyloidosis, Alzheimer's diseases, prinmary amyloidosis, Alzheimer's diseases, prinmary amyloidosis, Alzheimer's diseases, prinmary amyloidosis, Alzheimer's diseases, prinmary amyloidosis, light chain-related amyloidosis, light chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                            present sequence is a peptide forming the amyloid targeting moiety of the agent of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inhibiting cerebral amyloid angiopathy used for treating e.g. Alzheimer's disease comprises contacting blood vessel wall cell with amyloid-beta 40 inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Amyloid-beta40 inhibitor; Abeta40 inhibitor; cerebral amyloid angiopathy; CAA; nootropic; neuroprotective; cerebroprotective; Alzheimer's disease; cerebral haemorrhage; amyloidosis; haemorrhagic stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptide #2, used as a carrier for the amyloid-beta40 (Abeta40) inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

```
The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention can be used for treating disease states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary cerebral heamorinage with amyloidosis of the Dutch type and heamorinage stroke. The present sequence represents one of a group of peptides (AAU11648-AAU11659, AAU11910 & AAU11911) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeta40 inhibitor was used in the invention to treat a disease state characterised by cerebral amyloid angiopathy (CAA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  All-D-amyloid-beta peptide; Alzheimer's disease; rheumatoid arthritis; cerebral amyloid anglopathy; amyloid disease; ankylosing spondylitis; psoriasis; Reiter's syndrome; Adult Still's disease; Bechet's syndrome; Cohn's disease; infection; leprosy; tuberculosis; carcinoma; nootropic; chronic pyelonephritis; osteomyelitis; Whipple's disease; vasotropic; Hodgkin's lymphoma; neuroprotective; bronchiectasis; ophthalmological; ulcer; antiinflammatory; cytostatic; uropathic; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method for prevention and/or treatment of an amyloid-related disease which comprises administration of an all-D - amyloid-beta peptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Prevention and/or treatment of an amyloid-related disease e.g. Alzheimer's disease, comprises use of all-D-amyloid-beta peptides.

Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.

```
The present invention describes compositions (C) comprising: (a) a first agent (a) that pervents or treats amyloid-beta related disease, and (b) a second agent (a) that is: (i) a peptide or peptidominetic that captured a second agent (a) that is: (i) a peptide or peptidominetic that captured a second agent (a) that is: (ii) an immune system modulator that prevents or inhibite amyloid-beta (ii) an immune system modulator that prevents or inhibite amyloid-beta (ii) an immune system modulator that prevents or inhibite amyloid-beta (ii) an immune system modulator (c) (C) have contropic, neuroprotective, extitovascular, tranquilliser, uropathic, anticonvulsant, antidepressant, endocrine and hyporic activities, and can be used as amyloid-beta fibril formation modulators, and as and can be used as amyloid-beta fibril formation modulators, and as immune system modulators (C) can be used for preventing or treating an immune system modulators (C) can be used for preventing or treating anyloid-beta related disease e.g. Alzheimer's disease (including sporadic (nc)-hereditary) or familial (hereditary)), mild cognitive impairment, vascular dementa, manyloid angiopathy, hereditary) cerebral haemorrhage, senile dementa, or myloid angiopathy, hereditary cerebral haemorrhage, senile dementa, or pown's syndrome, inclusion body myositis, age-related macular cerebral continuing hypothyroidsm, cerebral disease, cardiovascular (including hypothyroidsm, cerebral disease, cardiovascular disease, amyotrophic lateral sclerosis, acquired immunoffician, cerebral sclerosis, acquired immunoffician, cerebral sclerosis, acquired immunoffician, cerebral sclerosis, acquired immunoffician, cerebral continuors, serunces, sensory loss, subdural, cartack or stroke, transient alcenses, attention deficit, frequent falls, attack or stroke, transient alertness, attention deficit, frequent falls, anchor, halloiderin, ascual disease, attention deficit, frequent falls, and the second modular or apprending amyloid-beta deposits. The present sequence represe

The present invention describes compositions (C) comprising: (a) a first agent (11) that prevents or treats amyloid-bet atlated disease; and (b) a second agent (a2) that is: (i) a peptide or peptidonimetic that cagent (a1) that prevents or peptidonimetic that modulates amyloid-bet affaril formation; or therspectic immune sepsones against amyloid-bet affaril formation; or (ii) an immune system modulator that prevents or inhibits amyloid-bet (iii) an immune system modulator that prevents or inhibits amyloid-bet (iii) an immune system modulator that prevents or and one of a mittonvulash, muscoular, tranquilliser, notrophic, neuroprotective, and said or noctropic, neuroprotective, and said prevents or preventing or treating an interval anti-HIV, antiparkimonian, muscular, and prevents or and can be used as amyloid-bet fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an amyloid-bet arelated disease e.g. Alzheimer's disease (including sporadic from predictary or familial (hereditary)), mild cognitive impairment, mild-to-moderate cognitive impairment, wascular dementia, cerebral modulators. (C) can be used for preventing or treating an amyloid-bet arelated disease e.g. Alzheimer's disease (including sporadic comparation, or a condition associated with Alzheimer's disease (including hypothyroidism, cerebral haemorrhage, senile dementia, bown's syndrome, inclusion body myositis, age-lated ameaular disease, memory loss, anxiety, a behavioural dysfunction (e.g. apathy, aggeneration, or incontinence), a neurological condition (e.g. apathy, aggenession, or incontinence), a neurological condition of deficits, incoordination, gait disturbance, transient ischemnic attendence, transient lateral dissease, paymoope, neuroleptic sensitivity, normal pressure hydrocephalus, subdural disease, paymoope, neuroleptic sensitivity, normal pressure hydrocephalus, alterdamusci confidention, depressed demential didention, depressed deposite. The pressent sequence represents a peptide re

The invention describes an isolated inhibitory peptide (1) which interacts with a hydrophobic beta-sheet forming cluster of amino acid cresidues on a protein or peptide for amyloid or amyloid-like deposit formation, and inhibits or structurally blocks the abnormal folding of proteins and peptides into amyloid or amyloid-like deposits and into optides into amyloid or amyloid-like deposits and into of diseases associated with abnormal protein folding into amyloid or amyloid or deposits, such as Alzaheimer's disease, bown's syndrome, other amyloidosis disorders, human prion diseases, ouch as kuru, Creutzfeldt-Jakob disease (UD) Gerstmann-Straussler-Scheinker syndrome (GSS), prion associated human neurodegenerative diseases as well as amimal prion diseases such as scrapie, spongiform encephalopathy, transmissible mink encephalopathy and chronic wasting disease of mule deer and elk. (1) is also useful for chronic wasting disease of mule deer and elk. (1) is also useful for chronic wasting disease of mule deer and elk. (1) is also useful for chronic mayloid associated with the inhibition of amyloid or amyloid like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 9 AA;

The invention relates to a human fusion antibody for preventing and treating senile dementia. The antibody recognises and binds the beta-amyloid peptide and the fibres generated by it. The human antibody Fo segment recognized by human immunocells are sequentially contained by its terminals from N to C. The fusion gene coding for the antibody is also disclosed. This sequence represents the sequence of a anti-beta-amyloid peptide antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Beta-amyloid; modulator; amyloid plaque; brain lesion; amyloidosis; cerebral blood vessel; Alzheimer's disease; amyloidogenic protein; familial amyloid cardiomyopathy; isolated cardiomyopathy; isolated cardiocamyloidosis; systemic senile amyloidosis; inulinoma; bovine spongiform encephalopathy; Creutzfeldt-Jakob disease; urticaria; adult-onset diabetes; familial Mediterranean fever; therapy; deafiness; scrapie; familial amyloid nephropathy; hereditary cerebral haemorrhage.
                                                                                                                                                                                                                                                                                                                                                                                                                          Human fusion antibody for reducing cerebral amyloid fibers associated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to inhibitory peptide comprising a portion of at least three amino acid residues and a sequence predicted not to adopt a beta-sheet structure that associates with a hydrosphobic beta-sheet cluster on a prociein or peptide involved in the abnormal folding into a beta-sheet structure, to structurally block the abnormal folding of the protein or peptide. The inhibitory peptide is useful for preparing a composition for preventing, treating or detecting disorders or diseases associated with amyloid-like fibril deposits e.g. Alzheimer's diseases prion related encephalopathies. The invention is also useful in gene therapy. The present sequence is a peptide used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New inhibitory peptide, useful for preparing a composition for diagnosing, preventing or treating disorders associated with amyloid-like fibril deposits, e.g. Alzheimer's disease, or prion related

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; beta-amyloid peptide; Alzheimer's disease; amyloidogenic protein; aggregation; neurotoxicity; amyloidosis; Down's syndrome; cardiomyopathy; familial amyloid polyneuropathy; bovine spongiform encephalopathy; Creutzfeldt-Jakob disease; bAP.
                                                                                                                                                                                                                                                      AAW02110-W02332 represent the peptide portions of the beta-amyloid modulator compounds of the invention. Beta-amyloid peptide is a 4 kilodaltor peptide that is the major protein component of amyloid plaques are present both in the brain lesions, and in the walls of cerebral blood vessels in Alzheimer's disease patients. The amyloid modulators of the invention comprise an amyloidogenic protein or peptide (such as this sequence) coupled directly or indirectly to at least one modifying group. The modifying group is preferably a cyclic, heterocyclic, or polycyclic group, such as declain, a cholanyl group, a biotin containing group, or a fluorescein containing group. These compounds then modulate the aggregation of these sequences to natural amyloid proteins or peptides when contacted with the natural
                                                                                                                                                                                                                                                                                                                                                                                                              amyloidogenic proteins or peptides. The modulator compounds can be used in the treatment of disorders associated with amyloidosis, such as familial amyloid cardiomyopathy, isolated cardiac amyloidosis, spremic senile amyloidosis, scrapie, bovine spongiform encephalopathy, Creuzfeldt-Jakob disease, adult-onset diabetes, insulinoma, familial Mediterranean fever, familial amyloid and other types of amyloidosis. The modulators are also useful for the treatment of disorders associated with beta-amyloidosis, specially Alzheimer's disease

The bAP derivatives inhibit aggregation of amyloidogenic proteins and peptides, specifically bAP, and their neurotoxicity, so are useful for treating and preventing any disease involving amyloidosis, specifically Alzheimer's disease but also Down's syndrome, familial amyloid polyneuropathy or cardiomyopathy, bovine spongiform encephalopathy and Creutzfeldt-Jakob disease. The bAP derivatives are also used to diagnose these diseases, in vitro or in vivo, by detecting binding of bAP to labelled bAP derivatives. Some bAP derivatives inhibit bAP aggregation even when bAP is present in molar excess. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Beta-amyloid; amyloid modulator; amyloidogenic protein; amyloidosis; familial amyloid polyneuropathy; familial amyloid cardiomyopathy; isolated cardiac amyloid; systemic senile amyloidosis; scrapie; myeloma; bovine spongiform encephalopathy; BSE; Creutzfeldt-Jakob disease; adult onset diabetes; Gerstmann-Straussler-Scheinker syndrome; insulinoma; atrial amyloidosis; idiopathic amyloidosis; haemodialysis; macroglobulinaemia-associated amyloidosis; reactive amyloidosis; primary localised cutaneous nodular amyloidosis; Sjogren's syndrome; hereditary cerebral haemorinage with amyloidosis; Muckle-Wells syndrome; hereditary non-neuropathic systemic amyloidosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New peptide(s) derived from beta-amyloid peptide that inhibit amyloid aggregation - and neurotoxicity, specifically for treatment and prevention of Alzheimer's disease.
                                                                                                                                                                                                                                                                                                  Hundal A, Gefter ML, Kasman L, Musso G, Molineaux S, Benjamin H;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ADJ64058
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                       The invention describes an amyloid modulator comprising an amyloidogenic protein and/or peptide fragment coupled to a modifying group so that the protein and/or peptide fragment coupled to a modifying group so that the compound modulates the aggregation of natural amyloid proteins or opeptides. The modulator is used for treating a disorder associated with amyloidosis e.g. familial amyloid cardiomypathy (Portuguese, Japanese and Swedish types), familial amyloid cardiomypathy (Portuguese, Japanese consolidate amyloido, systemic senile amyloidosis, scrapis, bovine spongiform encephalopathy. Creutzfeldt-Jākob disease, adult onset diabetes, Gerstmann-Straussler-Scheinker syndrome, insulinoma, isolated arrial amyloidosis, primary localised cutaneous carial amyloidosis, familial Mediterranean Fever and familial condary) amyloidosis, familial Mediterranean Fever and familial expectatory cerebral haemorrhage with siggren's syndrome, reactive condular amyloidosis associated with long term haemoflaysis, hereditary nor employed with amyloidosis of the thyroid, familial amyloidosis of the thyroid, familial amyloidosis associated hereditary carcinoma of the thyroid, familial amyloidosis associated hereditary systemic amyloidosis of the thyroid, familial amyloidosis and lysozyme-associated hereditary systemic amyloidosis and lysozyme-associated hereditary systemic amyloidosis con contacted with a molar excess amount of natural beta-Aps care amyloid protein (beta-Aps sequence represents a fragment of the relative to the modulator. This sequence represents a fragment of the relation of an amyloid modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Beta amyloid peptide; beta-AP; beta amyloid precursor protein; A-beta; APP-770; amyloid aggregation; amyloidogenic; Altheimer's disease; noncircopic; neuroprotective; immunosuppressive; antimicrobial; auditory; antidiabetic; antipyretic; dermatological; cardiovascular; nephrotropic; amyloid aggregation inhibitor; neurotoxicity inhibitor; Down's syndrome;
                                                                                                                                                                                                            Amyloid modulator useful for treating a disorder associated with amyloidoeis, comprises an amyloidogenic protein and/or a peptide fragment coupled to a modifying group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present invention describes an amyloid modulator compound (1) comprising an aggregation core domain and a modifying group attached to it. (1) has nootropic, neuroprotective, immunosuppressive, antimicrobial, antipyretic, dermatological, cardiovascular, nephrotropic and auditory activities, and can be used as a natural amyloid aggregation inhibitor and a neurotoxicity inhibitor of natural heta amyloid peptide (beta-Ap). (1) are used in the manufacture of a medicament for the diagnosis or treatment of an amyloidogenic disease e.g. Alzheimer's disease and other clinical occurrences of beta amyloid deposition such as now, s syndrome individuals and in patients with hereditary crebral cardiofosis such as familial amyloid polyneuropathy. (1) reduces the amyloidosis uch as familial amyloid polyneuropathy. (1) reduces the amyloidosis uch as familial amyloid polyneuropathy. (1) reduces the amyloidosis uch as familial amyloid polyneuropathy. (1) reduces the amyloidosis control of natural beta-Ap aggregates to cultured neuronal cells. (1) to control of the formation of neurotoxic aggregates but also have the ability to reduce the neurotoxicity of performed A-beta fibrils. The ability to reduce the neurotoxicity of performed A-beta fibrils. The present sequence represents a beta-Ap peptide, which is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Amyloid modulator compound useful for treatment of an amyloidogenic disease such as Alzheimer's disease comprises an aggregation core domain and a modifying group attached to it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Amyloidogenic protein; therapy; amyloidosis; familial amyloid polyneuropathy; cardiomyopathy; systemic senile amyloidosis; bovine spongiform encephalopathy; czerutzfeldt-Jakob disease; derstmann-Straussler-Scheinker syndrome; diaberes; insulinoma; myeloma; Sjogren's syndrome;

```
The invention relates to amyloidogenic proteins or peptide fragments aggregation modulators. The invention is used for treating disorder associated with amyloidosis, particularly familial amyloid oplyneuropathy cortuguese, Japanese and Swedish types), familial amyloid cardiomyopathy (Danish type), isolated cardiac amyloid, systemic senile amyloidosis, crapie, bovine spongiform encephalopathy, Creutzfeldt, Jakob disease, Gerapie, bovine spongiform encephalopathy, Creutzfeldt, Jakob disease, insulinoma, isolated atrial amyloidosis, didopathic (primary) amyloidosis, myeloma or macroglobulinemia-associated amyloidosis, primary localized cutaneous nodular amyloidosis associated with Sjogren's and familial amyloid nephropathy with urticaria and deafness (Muckle-Wells syndrome), hereditary cerebral haemorrhage with amyloidosis of celandic type, amyloidosis associated with long term haemodialysis, hereditary non-neuropathic systemic amyloidosis (familial amyloidosis polyneuropathy III), familial amyloidosis (Finnish type, amyloidosis associated with meditary non-neuropathy III), familial amyloidosis (Finnish type, amyloidosis associated with meditary non-neuropathic systemic amyloidosis (Finnish type, amyloidosis associated with meditary non-neuropathic systemic amyloidosis (Finnish type, amyloidosis associated with meditary non-neuropathic systemic amyloidosis (Finnish type, amyloidosis associated with meditary non-neuropathic systemic amyloidosis (Finnish type, amyloidosis associated with meditary non-neuropathic systemic amyloidosis (Finnish type) amyloidosis associated with meditary non-neuropathic systemic amyloidosis (Finnish type) amyloidosis associated with meditary non-neuropathic systemic amyloidosis (Finnish type) amyloidosis associated with meditary non-neuropathic systemic amyloidosis (Finnish type)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           hereditary renal amyloidosis and lysozyme-associated hereditary systemic amyloidosis. The present sequence is beta-amyloid peptide fragment used
familial mediterranean fever; urticaria; deafness;
hereditary cerebral haemorrhage; haemodialysis; thyroid;
renal amyloidosis; lysozyme-associated hereditary systemic amyloidosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New amyloidogenic protein aggregation modulators useful for treating disorder associated with amyloidosis e.g. familial amyloid polyneuropathy, Creutzfeldt-Jakob disease and adult onset diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 h Similarity 85.7%; Pred. The present invention describes compositions (C) comprising: (a) a first agent (al) that prevents or treats amyloid-beta related disease, and (b) a second agent (al) that is: (i) a peptide or peptidomiment that characteristic characteristic modulates amyloid-beta fibril formation or induces a prophylactic or therapeutic immune system modulator that prevents or inhibits amyloid-beta fibril formation; or corporation. Also described is a kit comprising (C). (C) have nootropic, neuroprotective, cerebroprotective, haemostatic, (C) have nootropic, neuroprotective, cerebroprotective, haemostatic, anticonvulsant, antithyroid, vaotropic, cardiovascular, tranquilliser, or pathal, antithyroid, vaotropic, cardiovascular, tranquilliser, cardiat, antitoprotessant, endocrine and hypnotic activities, and can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an can be used as amyloid-beta fibril formation modulators, and can be used as amyloid-beta dispares e.g. Altreimer's disease including sporadic (non-hereditary) or familial (hereditary)), mild cognitive impairment, andle-to-moderate cognitive impairment, vascular dementia, corditary, hereditary cerebral haemorrhage, senile dementia, commission body myositis, age-related macular disease, memory loss, anxiety, a behavioural dysfunction (e.g. apathy, agesesion, or incontinence), a neurological condition (e.g. apathy, agesesion, or incontinence), a neurological condition (e.g. apathy, symbodies, altered muscle tone, seizures, sensory loss, viatural disease, cardiovascular disease, amyotrophic lateral soletrosis, acquired immunodefictency symbodies, altered muscle tone, seizures, sensory loss, viatural disease, approprional condition (e.g. apathy, symbodie, altered muscle tone, seizures, sensory loss, viatural disease, approprional condition (e.g. depression, delicits, incoordination, gait disturbance, transient alerticantic per disease, per perpension, and disease, apathy, and disease, apathy, and a
Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                                                                                                                                                                Disclosure; Page 87; 143pp; English.

```
AAW02310-W02332 represent the peptide portions of the beta-amyloid modulator compounds of the invention. Beta-amyloid peptide is a 4 kilodalton peptide that is the major protein component of amyloid plaques. Amyloid plaques are present both in the brain lesions, and in the walls of cerebral blood vessels in Alzheimer's disease patients. The amyloid modulators of the invention comprise an amyloidogenic protein or peptide (such as this sequence) coupled directly or indirectly to at least one modifying group. The modifying group is preferably a cyclic, hetrocyclic, or polycyclic group, such as declain, a cholanty group, a fluorescens containing group. These compounds then modulate the aggregation of these sequences to natural amyloid proteins or peptides when contacted with the natural
                                                                                                                                                                                 ö

The present invention describes beta-amyloid peptide (bAP) derivatives. The bAP derivatives inhibit aggregation of amyloidogenic proteins and peptides, specifically bAP, and their neurotoxicity, so are useful for treating and preventing any disease involving amyloidosis, specifically Alzheimer's disease but also bown's syndrome, familial amyloid polyneuropathy or cardiomyopathy, bovine spongiform encephalopathy and creutzfeldt-Jakob disease. The bAP derivatives are also used to diagnose these diseases, in vitro or in vivo, by detecting binding of bAP to labelled bAP derivatives inhibit bAP aggregation
                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; beta-amyloid peptide; Alzheimer's disease; amyloidogenic protein; aggregation; neurotoxicity; amyloidosis; Down's syndrome; cardiomyopathy; familial amyloid polyneuropathy; bovine spongiform encephalopathy; Creutzfeldt-Jakob disease; bAP.
amyloidogenic proteins or peptides. The modulator compounds can be used in the treatment of disorders associated with amyloidosis, such as familial amyloid cardiomyopathy, familial amyloid cardiomyopathy, isolated cardiac amyloidosis, systemic senile amyloidosis, scrapte, bovine spongiform encephalopathy, Creutzfeldt-Jakob disease, adult-onset diabetes, insulinoma, familial Mediterranean fewer, familial amyloid emphropathy with urticata and deafhess, hereditary cerebral haemorrhage and other types of amyloidosis. The modulators are also useful for the treatment of disorders associated with beta-amyloidosis, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New peptide(s). derived from beta-amyloid peptide that inhibit amyloid aggregation - and neurotoxicity, specifically for treatment and prevention of Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hundal A, Gefter ML, Kasman L, Musso G, Molineaux S, Benjamin H;

even when bAP is present in molar excess. The present sequence represents
a bAP derivative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Amyloid modulator useful for treating a disorder associated with amyloidosis, comprises an amyloidogenic protein and/or a peptide fragment coupled to a modifying group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes an amyloid modulator comprising an amyloidogenic protein and/or peptide fragment coupled to a modifying group so that the compound modulates the aggregation of natural amyloid proteins or peptides. The modulator is used for treating a disorder associated with amy Swedish types), familial amyloid cardiomyopathy (Portuguese, Japanese spongish types), familial amyloid cardiomyopathy (Danish type), solated cardiac amyloid, systemic senile amyloidosis, scrapis, bovine spongiform encephalopathy, Creutzfeldt-Jakob disease, adult onset diabetes. Gerstmann-Straussler-Scheinker syndrome, insulinoma, isolated atrial amyloidosis, didopathic (primary) amyloidosis, myeloma or macroglobulinaemia-associated amyloidosis, primary localised cutaneous

Gecondary) amyloidosis, familial Mediterranean Fever and familial amyloid nephropathy with urticaria and deafness (Muckle-Wells syndrome), hereditary cerebral haemorrhage with amyloidosis (Muckle-Wells syndrome), hereditary cerebral haemorrhage with amyloidosis of Icelandic type, amyloidosis associated with long term haemodialysis, hereditary nonneuropathic systemic amyloidosis (familial amyloidosis of Finnish type, amyloidosis associated with medullary carcinoma of the thyroid, fibrinogen-associated hereditary renal amyloidosis and lysozyme-associated hereditary systemic amyloidosis. The compound is capable of altering and inhibiting beta-amyloid protein (beta-AP) aggregation of natural amyloidosinc proteins or peptides when contacted with a molar excess amount of natural beta-APs relative to the modulator. This sequence represents a fragment of the long form of beta-amyloid used in the creation of an amyloid modulator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Amyloid modulator compound useful for treatment of an amyloidogenic disease such as Alzheimer's disease comprises an aggregation core domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes an amyloid modulator compound (I) comprising an aggregation core domain and a modifying group attached to it. (I) has nootropic, neuroprotective, immunosuppressive, antimicrobial,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Beta amyloid peptide; beta-AP; beta amyloid precursor protein; A-beta; APP-770; amyloid aggregation; amyloidogenic; Alzheimer's disease; nootropic; neuroprotective; immunosuppressive; antimicrobial; auditory; antidiabetic; antipyretic; dermatological; cardiovascular; nephrotropic; amyloid aggregation inhibitor; neurotoxicity inhibitor; Down's syndrome; amyloidogenic disease; beta amyloid deposition; amyloidosis; hereditary cerebral haemorxhage; familial amyloid polyneuropathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

and auditory activities, and can be used as a natural amyloid aggregation inhibitor and a neurotoxicity inhibitor of natural bate amyloid aggregation (beta-Ap). (1) are used in the manufacture of a medicament for the citagnosis or treatment of an amyloidogenic disease e.g. Alzheimer's disease and other clinical occurrences of beta amyloid deposition such as prodrame individuals and in patients with hereditary cerebral commorrhage with amyloidosis, and for treating a disorder associated with amyloidosis, and for treating a disorder associated with amyloidosis, and gergetes to cultured neuronal cells. (1) cont only reduces the formation of neurotoxic aggregates but also have the ability to reduce the neurotoxicity of performed A-beta fibrils. The creating sequence represents a beta-AP peptide, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Amyloidogenic protein; therapy; amyloidosis; familial amyloid polyneuropathy; cardiomyopathy; systemic senile amyloidosis; bovine spongiform encephalopathy; cretuzfeldt-Jakob disease; dersemann-Straussler-Scheinker syndrome; diabetes; insulinoma; myeloma; Sjogren's syndrome; familial mediterranean fever; urticaria; deafiness; hereditary cerebral haemorhage; haemodialysis; thyroid; renal amyloidosis; lysozyme-associated hereditary systemic amyloidosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8×88888888888888888
                                                                                                                                                                                                                                                                                                                                                                                       ò
```

```
The invention relates to amyloidogenic proteins or peptide fragments aggregation modulators. The invention is used for treating disorder associated with amyloidosis, particularly familial amyloid polyneuropathy (Portuguese, Japanese and Swedish types), familial amyloid cardiomyopathy (Containsh type), isolated cardiac amyloid, systemic senile amyloidosis, Containsh type), isolated cardiac amyloid, systemic senile amyloidosis, isolated cardiac amyloidosis, adult onset diabetes, containsmn—Stramssler-Scheinker syndrome, adult onset diabetes, amyloidosis, myeloma or macroglobulinemia-associated amyloidosis, primary contains and tamilial amyloidosis, primary amyloidosis, familial Mediterranean Fever syndrome, reactive (secondary) amyloidosis, familial Mediterranean Fever cond familial amyloid nephropathy with urticaria and deafness (Mucklemalial syndrome), hereditary cerebral haemorrhage with amyloidosis of hereditary non-neuropathic systemic amyloidosis (familial amyloidosis polymeuropathy III), familial amyloidosis of familial amyloidosis of secondary familial amyloidosis of horeditary renal amyloidosis and lysozyme-associated hereditary renal amyloidosis and lysozyme-associated hereditary systemic amyloidosis. The present sequence is beta-amyloid peptide fragment used amyloidosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cerebrovascular disease; cardiovascular disease; memory loss; anxiety; behavioural dysfunction; neurological condition; psychological condition; vaccine antigen.

                                                                                                                                     The present invention describes compositions (C) comprising: (a) a first cases and (a1) that prevente or treats amyloid-beta related disease; and (b) a second agent (a1) that is: (i) a peptide or peptidomimetic that case agent (a2) that is: (i) a peptide or peptidomimetic that control and anyloid-beta fibril formation, or control amyloid-beta fibril formation, or corresponse against amyloid-beta inhibits amyloid-beta fibril formation. Also described is a kit comprising (C). (C) have notropic, neuroprotective, carebroprotective, haemostatic, (C) have notropic, neuroprotective, anti-lity, anti-parkinsonia, muscular, tranquilliser, uropathic, anticonvulsant, anti-lity, anti-parkinsonia, muscular, anti-depressant, anti-lity, anti-parkinsonia, muscular, and neurol-potective, beta as amyloid-beta fibril formation and/lators and as mayloid-beta fibril formation and/lators, and as immune system modulators. (C) can be used for preventing or treating an indicto-moderate cognitive impairment, vascular dementia, cerebral muscular, pro-moderate cognitive impairment, vascular dementia, cerebral mayloid-beta related disease e.g. Alzelmer's disease (including sporadic anyloid-apty, any pro-moderate cognitive indepartment, vascular disease, indictoning anyloid-apty myositis, age-lated macular dementia, cesebroardscular disease, ardiovascular disease, and monty loss, anxlety, a behavioural dysfunction (e.g. apathy, alsease, ammory loss, anxlety, a behavioural dysfunction (e.g. Huttington's disease, ammory loss, anxlety, a peravia, agnosia, pick disease, dementia disease, apparai, apraxia, agnosia, pick disease, dementia disease, amyotrophic lateral sclerosis, acquired immunodeficiency. Parkinson's disease, aphasia, apraxia, agnosia, pick disease, dementia cattack or stroke, transient alertness, attention deficit, frequent falls, hancoprominal disinhibition, poor insight, suicidal cattachin, depressed mood, irritability, anhedonia, social without anyloid-beta deposits. The present sequence represents a beta-aving amyloid-beta dep
                                  Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                          Disclosure; Page 87; 143pp; English.

```

forms of amyloid precursor proteins comprising from the 5' to the 3' end a sequence encoding a marker and either (1) a sequence encoding the N-terminus of an amyloid precursor protein (APP) up to, but not including, the nucleotides encoding the beta amyloid protein (BAP) domain or (2) the BAP domain; or the two ligated together, can be used to detect drugs or compounds that inhibit/augment the activity of proteolytic enzymes which cleave APP to generate BAP fragments (deposition of which occurs in patients with Alzheimesa disease and Down's syndrome). This is a fragment of amyloid precursor protein containing a mutation which is associated

with diseases involving BAP deposition

Recombinant polypeptides produced using the coding sequences of mutant

Disclosure; Page 35; 66pp; English.

cpds. that

New mutant forms of amyloid precursor protein - for detecting cpds. modify activity of enzymes involved in precursor cleavage, also new nucleic acid encoding them.

```
The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inhibiting cerebral amyloid angiopathy used for treating e.g. Alzheimer'e disease comprises contacting blood vessel wall cell with amyloid-beta 40 inhibitor.
                                                                                                                                                 Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Amyloid-beta40 inhibitor; Abeta40 inhibitor; cerebral amyloid angiopathy; CAA; nootropic; neuroprotective; cerebroprotective; Alzheimer's disease; cerebral haemorrhage; amyloidosis; haemorrhagic stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptide #20, used as carrier for the amyloid-beta40 (Abeta40) inhibitor.
                                                           Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.
                                                                                                                                                                                                                                                                                                     Score 30; DB 4; Length 9;

The present invention describes a method (MI) for analysing cleavage of a CC polymer. MI comprises: (a) providing a sample of the polymer, a portion composition composition of the polymer molecules having been labeled at a position on ne side of the potential cleavage site with a first isotopic label and a portion of the potential cleavage site with a second isotopic label; (b) compating the sample under conditions suitable for cleavage at the incubating the sample under conditions suitable for cleavage at the conditions suitable for cleavage at cleavage has taken place. MI is useful for analysing cleavage of where cleavage has taken place. MI is useful for analysing cleavage of polymer, where the polymer is a linear polymer, and comprises a peptide condition or improved synthetic substrates for both known and unknown enzymes, condition in prosticional peptide scanning clearity is ensuring methods at in a vivo/ex vivo/in vitro peptide, and in assaying methods for clearities, in in vivo/ex vivo/in vitro peptide, and in assaying methods conditional place.
                                                                                                                                                                                                                                                                                ö
can be used for treating disease states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary cerebral haemotrhage with amyloidosis of the Dutch type and haemotrhagic stroke. The present sequence represents one of a group of peptides (AAU11648-AAU1669, AAU15191 & AAU11191) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeta40 inhibitor was used in the invention to treat a disease state characterised by cerebral amyloid anglopathy (CAA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Analyzing cleavage of polymer, by providing polymer sample, incubating the sample with labeled isotope for cleavage at potential cleavage site, and analyzing the masses of any uncleaved fragments by mass spectrometry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mass spectrometry; polymer; analysis; cleavage; substrate specificity; isocope; protease.

The invention describes an isolated inhibitory peptide (I) which interacts with a hydrophobic beta-sheet forming cluster of amino acid residues on a protein or peptide for amyloid -like deposit formation, and inhibits or structurally blocks the abnormal folding of proteins and peptides into amyloid or amyloid-like deposits and into pathological beta-sheet-rich conformation. (I) is useful for disorders or diseases associated with abnormal protein folding into amyloid or amyloid-like deposits, such as Alzheimer's disease, Down's syndrome, other amyloidosis disorders, human prion diseases, such as kuru, Creutzfeldt-Jakob disease (CDD), Gerstmann-Straussler-Schelnker syndrome (GSS), prion associated human neurodegenerative diseases as well as animal prion diseases such as crapie, spongiform encephalopathy, transmissible mink encephalopathy and chronic wasting disease of mule deer and elk. (I) is also useful for detecting and diagnosing the presence or absence of amyloid or amyloid-
                                                                                                                                                                     ö
protein expression. The methods are useful for monitoring the cleavage of polypetrides or polymucleotides, and for determining optimal polymer substrates, 48P57505 to ABP57605 represent peptides used in the exemplification of the present invention

The invention relates to a method for prevention and/or treatment of an amploid-related disease which comprises administration of an all-D - amyloid-beta peptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and tavours the clearance of soluble amyloid-beta or fibril amyloid-beta from the mammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including inflammatory diseases e.g. rheumatoid arthritis, juvenile chropath, arthritis, ankylosing spondylitis, psoriasis, psoriatic arthropathy, Reiter's syndrome, Adult Still's disease, Bechet's syndrome and Crohn's disease. AA deposits are also produced as a result of chronic microbial infections (preferably leprosy, tuberculosis, bronchiectasis, decubitus clears, chronic pyelonephritis, osteomyelitis and Whipple's disease). Certain malignant neoplasms can also result in AA fibril amyloid deposits
                                                                                                                                                        ö
like deposits in vivo and its precursors. This is the amino acid sequence of peptide associated with the inhibition of amyloid or amyloid like

The invention relates to inhibitory peptide comprising a portion of at least three amino acid residues and a sequence predicted not to adopt a beta-sheet structure that associates with a hydrophobic beta-sheet cluster on a protein or peptide involved in the abnormal folding into a beta-sheet structure, to structurally block the abnormal folding of the protein or peptide. The inhibitory peptide is useful for preparing a composition for preventing, treating or detecting disorders or diseases associated with amyloid-like fibril deposits e.g. Alzheimer's disease prion related encephalopathies. The invention is also useful in gene therapy. The present sequence is a peptide used in the invention

The present invention describes an isolated amyloid beta peptide or its chomologue which is selected by a method comprising: (a) determining the homologue which is selected by a method comprising: (a) determining the binding value of each amino acid of a myloid beta peptide cupon binding to a Hind Lass I and/or class II molecule of interest; (b) determining the resulting score of all amino acids of the subsequence, cased on the binding value of each amino acids obtained in step (1); and cc a vaccine comprising the resulting score to a preselected value. Also described: (c) comparing the reaction of an individual beta peptide and a carrier or diluent; (2) determining T-cell epitopes within amyloid beta peptide; (3) predicting the reaction of an individual to a vaccine; (4) matching a vaccine comprising a beta amyloid or homologue peptide to an individual; (c) or immunisation of an individual based on the HLA haplotype of the individual; (s) a kit for matching a vaccine comprising amyloid beta on individual based on the HLA haplotype of the individual; (c) a kit for matching a vaccine comprising amyloid beta amyloid beta peptide has neuroprotective activity, and can be used in composition or vaccines. The amyloid beta peptide is useful for preparing a composition comprises. The amyloid beta peptide is useful for preparing a composition of preventing the formation or progression of amyloid plaques for preventing the formation or progression of amyloid plaques for represents an amyloid beta (bbeta) peptide, which is used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New amyloid beta peptide, useful for preparing a composition for preventing the formation or progression of amyloid plaques for preventing or treating Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidonimetic that modulates amyloid-beta fibril formation or induces a prophylactic or therapeutic immune response against amyloid-beta fibril formation; or therapeutic immune response against amyloid-beta fibril formation; or therapeutic immune system modulator that prevents or inhibits amyloid-beta fibril formation. Also described is a kit comprising (C). (C) have noctropic, neuroprotective, cerebroprotective, haemostatic, (C) noteropic, neuroprotective, response as anyloid-beta antithyroid, vasotropic, cardiovascular, tranquilliser, uropathic, anticonvulsant, antidepressant, endocrine and hypnotic activities, and can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an amyloid-beta related disease e.g. Alzaheimer's disease (including sporadic (non-hereditary) or familial (hereditary)), mild cognitive impairment, amyloid angiopathy, hereditary cerebral hemorrhage, senile dementia, amyloid angiopathy, hereditary cerebral hemorrhage, senile dementia, commune syndrome, inclusion body myositis, age-related macular (including hypothyroidism, cerebral hemorrhage, cardiovascular disease, memory loss, anxiety, a behavioural dysfunction (e.g. Huntington's aggression, or incontinence), a neurological condition (e.g. Huntington's
                                                                                                                        amyloid-beta; amyloid-beta related disease;
